Security risk assessment report

Part 1: Select up to three hardening tools and methods to implement
1. Update password policies 2. Port Filtering 3. Encryption

Part 2: Explain your recommendations
1. Using NIST's latest recommendation for password policies would help. Their recommendations focus on salting and hashing, will address employees at this company sharing passwords. In addition it will eliminate the need for frequent password changes and requiring overly complex passwords. This would also address the issue with the admin password for the db being set to default. The salting and hashing would help to fight against hackers guessing the password. 2. Port filtering will control network traffic and can prevent potential attackers from entering the network. Currently this company does not have any rules in place to filter traffic coming in or out of the network. 3. Encryption using the latest standards will help to conceal outgoing data and uncover or decrypt incoming data. Currently there is nothing in place at this company for filtering traffic that comes in or goes out.
