Cybersecurity Incident Report: Network Traffic Analysis

Part 1: Provide a summary of the problem found in the DNS and ICMP traffic log.
The UDP protocol reveals that: the packet was undeliverable to port 53 of the DNS server. This is based on the results of the network analysis, which show that the ICMP echo reply returned the error message: UDP port 53 unreachable length 320. The port noted in the error message is used for: DNS service. The most likely issue is: there was no service listening on the receiving DNS port.

Part 2: Explain your analysis of the data and provide at least one cause of the incident.
Time incident occurred: 1:24 pm Explain how the IT team became aware of the incident: Several client reported that they could not access the website yummyrecipesforme.com Explain the actions taken by the IT department to investigate the incident: First the IT department tried to visit the website and receives the same error: "destination port unreachable". They then loaded the analyzer tool tcpdump to try to load the page again. Note key findings of the IT department's investigation (i.e., details related to the port affected, DNS server, etc.): The analyzer tool showed that when they send the UDP packets to the DNS server, ICMP packets came back with error message saying "udp port 53 unreachable". Note a likely cause of the incident: the likely cause was that there was no DNS service listening on the DNS port.
