Algorithm for file updates in Python

Project description

My job is the create an algorithm that uses python to check whether or not the allow list of IP addresses contains addresses that have been identified on the remove list. If there are some that should be removed, I need to remove them from the allow list file.

Open the file that contains the allow list

The open() function allowed me to open the allow list file.. The open import is the 1st parameter of the function. To only open the file I wouldn't need the second parameter of "r" which allows me to read it.

```
# Assign `import_file` to the name of the file

import_file = "allow_list.txt"

# Assign `remove_list` to a list of IP addresses that are no longer allowed to access

remove_list = ["192.168.97.225", "192.168.158.170", "192.168.201.40", "192.168.58.57"]

# First line of `with` statement

with open(import_file, "r")as file:
```

Read the file contents

The "r" function allowed me to read the contents of the allow list file as shown in the screenshot above. The "r" function preceded by the comma is the second parameter of the function.

Convert the string into a list

The ".split()" allowed me to convert the string of IP addresses into a list. Which resulted in each IP address being on a new line in the allow list file.
